# Proposal for an Integrated Operations Platform

**Prepared for:** D & S Electric Works (DSEW), 109, Industrial Area Extension, Rau, Indore 453331, Madhya Pradesh **Attention:** Mr. Anurag Sharma **Reference:** DSEW ERP enquiry **Prepared by:** [Company legal name], [city] **Date:** [dd Month yyyy] **Validity:** 60 days from the date above **Status:** Confidential. Prepared for DSEW only.

---

Dear Mr. Sharma,

Thank you for inviting us to respond. Your enquiry describes something many vendors will under-deliver on: not a generic ERP with a few forms added, but one system that follows a job from the first customer enquiry, through engineering and controlled documents, procurement, winding and assembly, testing and dispatch, to the invoice and the warranty that follows. We read the enquiry that way and have written this proposal that way.

## What we are proposing

We will build DSEW's system on **Verity**, our own platform for service and manufacturing businesses, rather than customising someone else's ERP. Verity already provides the hard foundations your requirement depends on: strict separation of each company's data, role-based permissions, a complete audit trail, a stock ledger that cannot be silently edited, manufacturing orders with route stages and quality checkpoints, project jobs with quote revisions, approvals, printable travellers and a QR identity for finished units. These are working today. What we build for DSEW is the part that makes it yours: revision-controlled BOMs, controlled engineering documents, structured test records with tolerances, lot and heat traceability, your numbering rules, your travellers, your quality formats and the integrations you asked for.

## Why this approach is good for DSEW

1. **A working system early.** You can see a working demonstration of the foundation now, with fictional data. The first production-ready release is planned for roughly four months after the requirements are agreed.
2. **No lock-in in the way that matters most.** Your data is yours, exportable in open formats at any time. Your configuration, templates, numbering rules and DSEW-specific work are yours. The technology stack is open source with no per-user licence. Document 4 answers your source-code questions one by one and explains honestly where a shared platform differs from a one-off build.
3. **Honest about what is hard.** We tell you where something is proven, where it still has to be built, and where we need to verify before we promise (for example, running on your Windows Server 2019 and the attendance device). You will not find a surprise at go-live that we knew about at signing.
4. **Priced to be fair, in rupees, with the whole cost visible.** Three options, a fixed price per phase, no per-user or per-module subscription, and a five-year ownership cost so you can compare us on the real number.
5. **Built with your people.** Each two-week sprint ends with a demonstration of working software on a test environment that your team can use. Your engineers and quality staff decide whether it fits, not a presentation.

## What is in this package

| # | Document | What it answers |
|---|---|---|
| 1 | Technical Proposal | Solution, module-by-module coverage (A to S), AI, user experience, architecture and deployment, security |
| 2 | Commercial Proposal | Three options, module-wise prices, payment milestones, AMC, rates, five-year cost |
| 3 | Implementation Plan | Phases, sprints, acceptance criteria, UAT, migration, training, handover, risks |
| 4 | Ownership, Licensing and Source Code | Every question in section 5 of your enquiry, answered directly |
| 5 | Company, Team and Experience | Who we are, who will work on this, references and support |
| 6 | Assumptions, Exclusions and Information We Need | What we assumed, what is not included, and the short list of inputs that unlock fixed dates and prices |

## What we need from you to move quickly

A short working session with your engineering and quality heads, sample documents (a drawing, a BOM, a QAP, an ITP, a test report and a traveller you use today), your existing numbering convention, and basic facts about your server. Document 6 lists them. With these, we turn the proposal into a signed Software Requirements Specification within three weeks.

We would be glad to present this in person at your Rau facility, walk through the working demonstration with your team, and answer questions before you decide.

Yours sincerely,
