

verity

Every lot, every bundle, every karigar. One calm screen.

A Verity workspace built around how Stylified pays by the piece: from the first cut to the last good shirt, with the owner, the manager, the supervisor and the munshi each seeing exactly what they need.

PROPOSAL

22 October 2026

DOCUMENT

1 of 5

Know where every piece is.

Verity gives Stylified a living picture of the factory: what is out with which karigar, what came back good, what needs rework, what is late, and what is owed, all worked out from the entries your team makes, never typed in twice.

OXFORD FORMAL

WINTER FLANNEL

SUMMER POPLIN

EXPORT CHECK

ONE WORKSPACE

4 roles

Owner, manager, supervisor and munshi, each with their own screens.

BUILT FOR THE FLOOR

6 supervisor screens

Phone-first, in Hindi and English, with a photograph from the camera.

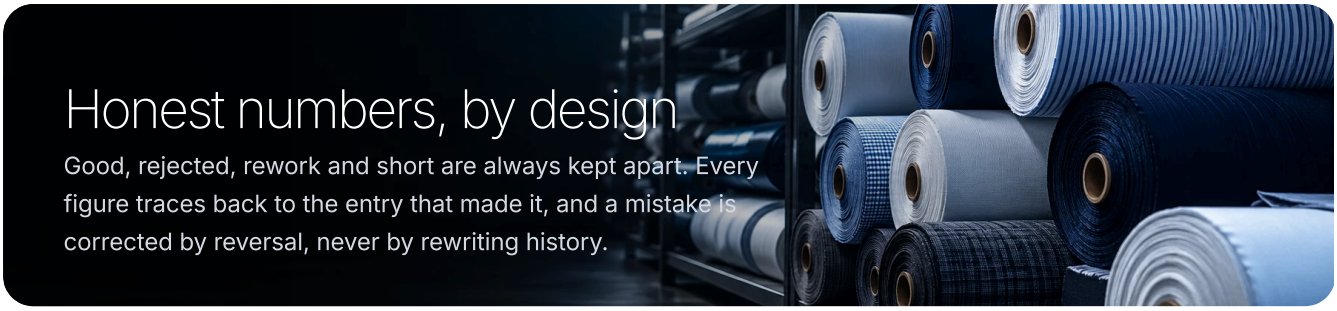

READY QUICKLY

~3 weeks

From kickoff to your own live workspace, with a demonstration at week two.

01 What changes for each person

WHO	BEFORE	WITH VERITY
Owner	Asking around to learn where a lot is and who is waiting to be paid	One factory screen: a ring gauge of every piece, a floor board by stage, what is late, what is owed
Manager	Deductions and write-offs argued from memory	An approvals inbox with the facts and a photograph, decided from a phone
Supervisor	Registers, counts that do not add up, no proof of a defect	A phone-first screen for their stages: take a bundle back, count with plus and minus, add a photo, see the numbers reconcile
Munshi	Typing the same figures into more than one place	Enter once, in Hindi or English, and print a bilingual slip with a QR for every bundle

Honest numbers, by design

Good, rejected, rework and short are always kept apart. Every figure traces back to the entry that made it, and a mistake is corrected by reversal, never by rewriting history.

02 What is in your workspace

Lots and bundles

Plan a lot, cut numbered bundles (B-0001 onward, no gaps), and print a slip with the bundle number, net pieces, lot and a QR. Lots move through draft, active, on hold, completed and closed.

Issue, take back, rework

Give a bundle to a karigar or an outside unit with a due date. Take it back split into good, rejected, rework and short, with a live "accounted for 96 of 98" line. Rework goes back out and is counted on its own.

Wages and accounts

Wage basis per karigar and stage (issued, returned or accepted good). Advances, recoveries, deductions with a reason, and payments with mode and reference. Every karigar has a clear account.

Dashboards and reports

A factory dashboard for the owner, a floor board by stage, and eight reports that download for Excel: lot status, where each bundle is, work in hand, wages, quality and more.

Photographs

A cover photo for every lot and defect photographs attached to rejected or rework entries, so a conversation about quality starts from the picture.

Hindi and English

Slips, daily entry and every supervisor screen in both languages, chosen per user. Dark and light themes for the cutting room and the evening shift.

03 Your investment

SETUP

₹25,000 + GST

Customization to Stylified, supervisor and manager screens, roles, bilingual labels, a seeded demonstration, training and go-live.

MONTHLY

₹15,000 a month

Hosting, upkeep and the Verity platform together: one simple monthly amount, with nothing else to buy.

WHAT THE MONTHLY AMOUNT COVERS	IN PRACTICE
Server	Hosting in an Indian data-centre region, database, photograph storage, security patching and monitoring. You pay no separate hosting bills
Maintenance and support	Fixes, small configuration changes, user and role changes, support on working days, backups and a rehearsed restore
Subscription	The right to use Verity, and every improvement we release to it

The monthly amount is inclusive of GST; the setup amount is plus GST at the prevailing rate. Setup is invoiced half at kickoff and half at go-live. The monthly amount begins at go-live.

Where it runs, and where it can go

Your workspace is hosted by PlotArmour in an Indian region, with your data isolated from every other customer. When you want it, we can quote a move to **your own Vercel and Supabase accounts, in your name**, with your hosting bills kept inside the same monthly amount. We will offer it once it has been through a full rehearsal, and until then you can export all your data whenever you ask.

04 The road to go-live

WHEN	WHAT HAPPENS
Day 0	Kickoff call: confirm the build decisions (document 2) and your user list
Week 1	Roles, stage assignment, the supervisor floor view and receive-and-inspect screen
Week 2	Reissue board, rework and shortage register, day close, photographs, Hindi labels. **You see it working on your own lots**
Week 3	Your feedback, polish, training, and go-live on your own workspace

05 What comes next

The MVP is the heart of the cycle. When Stylified is ready, the same workspace grows with it, each step quoted on its own:

Fabric	Inward, a metre ledger, issue to lot, returns and adjustments
Costing	Twelve cost categories and cost per good piece for every lot
Packing and dispatch	Ready stock, packets, parties and transport references
Split and join	Bundles and lots, with cost allocated automatically
More	A full Hindi interface, an audit viewer, native Excel and PDF export, barcode scanning

06 Getting started

- Tell us "go" and name the person who decides for Stylified.
- Share your user list, which supervisor looks after which stages, and your karigar names and rates (or start empty and add them yourselves).
- Give each supervisor a phone or tablet with internet; the workspace runs online.

Next step: reply to team@plotarmour.in with "Go ahead" and we will send the kickoff date. We would be glad to walk you through the workspace on a call first.

Service starts at go-live with an initial term of three months, then continues month to month; the full terms are in document 3. This proposal is valid for 30 days from 22 October 2026. PlotArmour, 31/44 St 3, Block 17, Vishwas Nagar, Delhi 110032 · GSTIN 07TQDPS9711L1ZT · team@plotarmour.in · +91 87440 69597.

verity

MVP build and demo plan

What gets built for Stylified, who sees which screen, how the demonstration runs, and how we agree it is done.

What we build, and for whom

The MVP is the smallest Verity workspace that lets the owner, a manager, a supervisor and the munshi run a real lot from cutting to ready stock, with money and quality kept honest. It reuses a working core and adds what the floor needs: supervisor screens, a role set, approvals, photographs and bilingual labels.

01 What the demonstration has to prove

TO WHOM	THEY SHOULD LEAVE BELIEVING
Owner	"I can see where every piece is, what is late and what I owe, without asking anyone."
Manager	"Deductions and write-offs come to me with the facts and a photograph, and I can say yes or no from my phone."
Supervisor	"My screen is my stages only. Receiving a bundle takes a minute and I cannot make a counting mistake without being told."
Munshi	"I enter once, in Hindi or English, and the slip is printed. Nothing is typed twice."

02 What already exists

These parts of the cycle are built and covered by automated tests (28 logic tests and 23 database tests for the piece-rate core, plus the platform's tenancy and permission tests). They have been opened in a browser on a local copy with fictional data. They are **not yet on a Stylified workspace**.

AREA	WHAT WORKS TODAY
Lots	Draft, active, on hold, completed, closed; planned against cut pieces; due dates; a lot cannot complete while pieces are pending or in rework
Bundles	Numbered B-0001 onward without gaps; net pieces; printable bilingual slip with a QR that opens the bundle
Movement	Issue a bundle at a stage to a karigar or outside unit with a due date; take it back split into good, rejected, rework and short, with a live "accounted for X of Y" line; rework waits in a pool and is reissued
Wages and money	Wage basis per karigar and per stage (issued, returned or accepted good), advances, recoveries, deductions with a reason, payments with mode and reference; corrections by reversal only
Owner views	Factory dashboard with a ring gauge of where the pieces are, a floor board by stage, what is late, what is owed; eight reports with CSV download

AREA	WHAT WORKS TODAY
Platform	Per-company data isolation, sign-in, role-based permissions, audit trail, bilingual slip, dark and light themes

03 MVP scope

ITEM	WHO IT IS FOR	STATUS
Role set: Owner, Manager, Supervisor, Munshi, with the matrix in section 4	All	NEW
Supervisor stage assignment (which stages a supervisor looks after)	Owner sets, Supervisor limited by it	NEW
Supervisor screens S1 to S6 (section 5)	Supervisor	NEW
Approvals: deduction, shortage write-off, lot hold or close, with limits the owner sets	Manager, Owner	NEW
Photographs: a lot cover photo, and defect photos on rejected or rework entries	Munshi, Supervisor, Owner	NEW
Bilingual Hindi and English labels on daily entry and all supervisor screens	Munshi, Supervisor	NEW
In-app alerts for late returns and open shortages	Supervisor, Manager, Owner	NEW
Speed work: fewer database round trips per page, instant press feedback, a loading bar	All	IN PROGRESS
Lots, bundles, slips, issue and return, rework, wages, money, dashboard, reports	Owner, Manager, Munshi	EXISTS
Seeded demonstration with fictional data and a reset command; half-day training; go-live on Stylified's workspace	All	NEW

04 Roles and what each can do

Permissions are checked on the server for every action, never only by hiding a button. "Own stages" means only the stages the owner has assigned to that supervisor.

ACTION	OWNER	MANAGER	SUPERVISOR	MUNSHI
See the factory dashboard and all lots	Yes	Yes	Own stages	Yes
See wage rates, wages and balances	Yes	Balances only	No	Own entries

ACTION	OWNER	MANAGER	SUPERVISOR	MUNSHI
Cut a bundle, print a slip	Yes	Yes	No	Yes
Give a bundle out (issue)	Yes	Yes	Own stages	Yes
Take a bundle back and inspect (return)	Yes	Yes	Own stages	Yes
Reissue rework	Yes	Yes	Own stages	Yes
Raise a shortage	Yes	Yes	Own stages	Yes
Write off a shortage	Yes	Approves within limit	Requests	Requests
Record an advance, recovery or payment	Yes	Within limit	No	Yes
Record a deduction	Yes	Approves within limit	Requests	Requests
Reverse a wrong entry (with a reason)	Yes	Yes	Own entries, same day	Own entries, same day
Activate, hold or complete a lot	Yes	Yes	Request a hold	No
Close a lot	Yes	Approves within limit	No	No
Reports	All	All except wage ledger	Floor reports	Today's entries
Users, roles, stage assignments, limits	Yes	No	No	No

The exact limits (for example the rupee amount a manager may approve) are set by the owner on screen. The workbook's matrix is confirmed with Stylified at kickoff.

05 The supervisor screens

Supervisors work standing on the floor with a phone, so these screens are designed phone-first: one task per screen, large touch targets, counts entered with plus and minus controls, and no wage figures anywhere. On a desktop they use the same layout, wider.

S1 · My floor

SUPERVISOR · PHONE AND DESKTOP

- The stages this supervisor looks after, as chips, and today's date.
- One ring gauge: pieces in my stages, split into out with karigars, waiting to be issued, rework and short.
- "Late and due today": one card per open issue, showing the bundle, the karigar, pieces still out and the due date. Tapping a card opens S2 for that issue.
- Two big buttons: *Take back* (S2) and *Give out* (S3).
- Alerts for this supervisor's stages at the top, tappable.

S2 · Receive and inspect

SUPERVISOR · PHONE FIRST

- Choose the issue coming back (cards grouped by karigar, each showing pieces out).
- Enter good, rejected, rework and short with plus and minus steppers. A live line reads "accounted for 96 of 98, 2 will stay open"; it turns red if the total is more than the pieces out, and Save stays disabled.
- Rejected and rework need a reason (stitch defect, measurement, stain, hole, other) and accept a photograph taken with the phone camera.
- Saving writes one entry that cannot be edited later, only reversed with a reason. If rejected pieces would justify a wage deduction, the screen offers "Request deduction", which goes to the manager.

S3 · Give out

SUPERVISOR · PHONE AND DESKTOP

- Bundles waiting at my stage appear as cards with their pieces and the lot's cover photo.
- Pick a karigar (the screen shows what they already hold and whether a rate is set), set the due date, and give out. The wage basis defaults to the karigar's usual and can be changed for one job.
- Rework waiting in the pool is reissued from the same screen and carries its own "rework" flag.

S4 · Rework and shortage register

SUPERVISOR, MANAGER

- Every open rework piece by bundle and age, with the reason and photograph from when it came back. One tap reissues it.
- Every open shortage (pieces that did not come back and cannot be found). The supervisor can mark one found, or request a write-off, which goes to the manager with the history.
- Nothing here changes a good count: rework is not output until it is redone and accepted.

S5 · Day close

SUPERVISOR → OWNER AND MANAGER

- A one-screen summary of the day for my stages: pieces given, taken back, good, rejected, rework, short, and what is late.
- A short handover note in Hindi or English. Submitting it freezes the summary for the owner and manager to read.
- Open warnings (a late return, an unreconciled shortage) are listed but do not block the close.

S6 · Karigar quick view

SUPERVISOR

- For a karigar: pieces held now, due dates, today's returns, and their reject and rework rate over the last 30 days. No rates, wages or balances.

Manager screens

M1 · Approvals

MANAGER, OWNER

- One inbox: deduction requests, shortage write-offs, lot hold and close. Each shows the facts (bundle, karigar, amount or pieces, the photograph, who asked) and two buttons, approve and decline with a reason.
- Anything above the manager's limit is shown but only the owner can approve it.

M2 · Limits and assignments

OWNER

- Set the rupee limits for manager approvals, assign stages to each supervisor, and see each supervisor's day closes.

06 The fourteen build decisions

Your requirement sheet left fourteen questions open. We decided each from the sheet's own suggested default, and each can be changed by configuration, not by a rebuild. **Please confirm or change them at kickoff.**

ID	DECISION	APPLIES TO
D-01	Bundle quantity is free per bundle; no mandatory size split; an optional size-mix note	MVP
D-02	Wage basis is set per karigar and stage and can be overridden on one issue: issued, returned or accepted good	MVP

ID	DECISION	APPLIES TO
D-03	No automatic wage deduction for short or rejected pieces; the system flags it for an approved deduction	MVP
D-04	An advance is recovered only by an explicit entry of a chosen amount, never silently	MVP
D-05	Each cost category is a separate entry with an "included in another rate" flag to stop double counting	Phase 2
D-06, D-07	The labels "Thread" and "Side Feed Up" are data you can change without code	Phase 2
D-08	A movement names a process and a karigar, unit or place; no separate floor or table master yet	MVP
D-09	Split and join allocate cost by quantity or an approved percentage that always sums to 100	Phase 2
D-10	Fabric inward takes date, rate and amount as optional; lot fabric cost is metres used times the inward rate	Phase 2
D-11	Online-first web app; no offline mode in this phase	MVP
D-12	Opening ready stock can be entered on launch day as an opening adjustment	MVP
D-13	Owner full; Manager limited by approval limits; Supervisor scoped to assigned stages (section 4)	MVP
D-14	Dispatch (lot, packet, quantity, party, transport reference) can be switched off per workspace	Phase 2

07 After the MVP: what is quoted separately

ITEM	WHY IT WAITS
Fabric inward and the metre ledger (decimal quantities, issue to lot, returns, adjustments)	Needs a new kind of quantity (metres) and a stock ledger of its own
Twelve-category lot costing with cost per good piece	Depends on fabric and on your cost categories
Packing, ready stock and dispatch	Needs parties, packets and transport references
Bundle and lot split or join with cost allocation	Depends on costing
Full Hindi interface with a language switch	Touches every screen; the MVP is bilingual on entry and supervisor screens only

ITEM	WHY IT WAITS
Store Manager role, configurable alert thresholds, an audit viewer, native Excel and PDF export, barcode scanning	Each is a separate piece of work
Move of the workspace to Stylified's own Vercel and Supabase accounts	Needs install steps we have not yet scripted or validated (the database runtime role, the first-operator setup, scheduled jobs, file backups); quoted once validated. See document 1, section 2

08 What changes under the hood

For readers who want to know what "customization" means in practice. Detail is in document 5.

- **Roles.** Four roles are created from permissions (an action on a record type within a scope). No role name is fixed in the code.
- **Stage assignment.** A small record links a supervisor to the stages they look after. The piece-rate commands check it before accepting an issue or a return from a supervisor. The platform's own scope list is not changed.
- **Approvals.** A request record (deduction, write-off, hold, close) with a state, an amount or quantity, the people involved and the decision. The existing approval substrate of the platform is reused.
- **Photographs.** A file reference on the lot (cover) and on a return entry (evidence), stored in the platform file store with the same company isolation as every other record.
- **Bilingual labels.** A small label catalogue for the daily-entry and supervisor screens; the language is chosen per user.
- **Alerts.** Events for late returns and open shortages, shown in the notification bell. No SMS or WhatsApp in the MVP.

09 The demonstration

About fifteen minutes, on fictional data that includes the reconciliation from your own sheet (100 pieces: 94 good, 2 rejected, 1 rework, 2 short, 1 still open), one late outside unit and one lot on hold. A reset command returns the workspace to this state.

#	WHO	SCENE	SHOWS
1	Owner	Open the factory dashboard	Ring gauge, what is late, what is owed, the floor by stage
2	Munshi	Cut a bundle, print the slip, give it to a karigar	Gapless numbering, bilingual slip with QR, due date
3	Supervisor (phone)	My floor, then take a bundle back	Stage-scoped view, counting steppers, "accounted for 96 of 98", a photograph on a rejected piece
4	Supervisor	Try to take back more pieces than are out	The screen refuses with the figures

#	WHO	SCENE	SHOWS
5	Supervisor	Reissue the rework; raise a shortage	Rework flag, shortage register, request to the manager
6	Manager (phone)	Approve a deduction and decline a write-off	Approvals inbox with the photograph and the facts
7	Supervisor	Close the day with a Hindi note	Day summary the owner can read
8	Owner	Open the karigar's account and the reports	Wages on the agreed basis, advance recovered, CSV download
9	Supervisor	Try to open wages	Refused: supervisors never see money

10 How we agree it is done

1. All four roles can sign in, and each sees only the screens in section 4. A supervisor cannot issue or receive at a stage that is not assigned to them, tested with a second supervisor.
2. The reconciliation from your sheet reproduces exactly: 100 = 94 + 2 + 1 + 2 + 1 open.
3. A return that accounts for more pieces than are out is refused with the figures; a correction is a reversal, and both rows stay.
4. A rejected or rework entry accepts a photograph, and the photograph shows on the bundle and in the approval.
5. A deduction or write-off above the manager's limit cannot be approved by the manager; the owner can.
6. A closed lot cannot be changed.
7. Every screen in this document opens at desktop width and at 390 px phone width, in both light and dark themes, with the demonstration data and no unrecorded defect.
8. Hindi labels show on daily entry and every supervisor screen for a user whose language is Hindi.
9. The demonstration reset command restores the data in under a minute.
10. A backup is taken and a restore is rehearsed on the Stylified workspace before go-live.

11 Schedule and risks

WEEK	BUILD	CHECKPOINT
0	Kickoff, decisions, user list, stage names	Decisions confirmed in writing
1	Roles, stage assignment, S1 and S2, approvals data	Supervisor can sign in and take a bundle back
2	S3 to S6, M1 and M2, photographs, bilingual labels, alerts	**Demonstration to Stylified**
3	Your feedback, hardening, training, go-live	Acceptance in section 10

RISK	WHAT WE DO
Decisions or user lists arrive late	Dates move by the same number of days; we say so in writing
Floor internet is weak	The MVP is online only (D-11); if it is a real problem, offline entry is a separate quote
The wage matrix or limits differ from the sheet	They are settings, changed on screen; we confirm them in UAT
Scope grows during the build	A written change request with a price and a date before any extra work starts

verity

Service terms

Hosting, support, backups, your data, the initial term, and how either side can end the service.

DRAFT, SUBJECT TO LEGAL REVIEW

BETWEEN

PlotArmour and Stylified

PREPARED BY

PlotArmour
team@plotarmour.in · +91 87440 69597

DATE

22 October 2026

DOCUMENT

3 of 5

The terms, in plain language

These are the working terms for the hosted Verity service described in document 1. They are written to be read by a business owner. The wording is reviewed by a lawyer before it is signed, and any number in it can be discussed.

01 The service and the term

- **What you get.** A Verity workspace for Stylified, hosted by PlotArmour, configured to the MVP scope in document 2, for up to **10 named users** and **one unit**. More users or units, and any new module, are priced separately.
- **Start.** The service starts on the **go-live date**, when Stylified accepts the MVP against the criteria in document 2, section 10.
- **Initial term.** The service begins with an initial term of **3 months from go-live**, billed monthly in advance, which gives us time to tune the workspace to how Stylified works.
- **After the initial term.** The service continues month to month. Either side may end it by giving **30 days' written notice** (email is enough); the last invoice covers the notice period.

02 Fees, invoices and GST

ITEM	AMOUNT	WHEN IT IS INVOICED
One-time customization (₹25,000 + 18% GST = ₹29,500)	₹14,750 and ₹14,750	First part at kickoff, second on go-live acceptance
Monthly fee, GST included: server ₹4,500, maintenance ₹4,000, subscription ₹6,500	₹15,000	Monthly in advance, from the go-live date

- Invoices are payable within **7 days**. GST is charged at the rate in force; PlotArmour is registered in Delhi (GSTIN 07TQDPS9711L1ZT), so IGST applies to a customer in Punjab.
- If a monthly invoice is more than **15 days** overdue, we may suspend access after 5 days' written warning. Data is kept while the service is suspended and access is restored when the invoice is paid.
- Fees for the MVP scope are fixed. We may change the monthly fee after the initial term with 60 days' written notice; if Stylified does not agree it may end the service under section 1.

03 Hosting and availability

- The workspace runs on Verity's hosted platform in an Indian data-centre region, with its own isolated data inside a shared, secured system. No other customer can read Stylified's records.
- We aim for the service to be available at least **99.5% of each month**, not counting planned maintenance announced at least 24 hours ahead and problems with Stylified's own network or devices. This is a target

we work to, not a guarantee, and it carries no automatic refund.

- Security fixes and platform improvements are applied by us as part of the monthly fee.
- Stylified pays no separate hosting, database or storage bills. They are covered by the server line of the monthly fee.

Moving to Stylified's own accounts (an option, not part of the MVP)

- Stylified may ask to move its workspace to **its own Vercel and Supabase accounts, in Stylified's name**. We offer this once we have validated that way of running Verity, and quote the move separately. We do not promise a date, and we will not move a live workspace until a rehearsal on a test copy has passed.
- While the accounts are billed to PlotArmour, the provider charges stay inside the ₹4,500 server line and the ₹15,000 monthly fee does not change. If provider charges ever rise beyond what that line can carry, we will tell Stylified in writing with 60 days' notice before any change to the fee.
- Stylified is the account owner. It can see everything in those accounts and can revoke our access at any time; our access is recorded and limited to supporting the service. If access is revoked, we cannot support the workspace until it is restored, and the monthly fee continues for the initial term.
- Each provider's own terms apply to the accounts, including any limit on commercial use of its plans; we will choose plans that allow Stylified's business use.
- The move needs a short, announced downtime and a data check before and after. The old copy is kept for 30 days and then deleted.

04 Support

KIND OF PROBLEM	EXAMPLE	FIRST RESPONSE
Critical	Nobody can sign in, or entries cannot be saved	Within 4 working hours
Normal	A report is wrong, a screen misbehaves, a user cannot see something they should	Within 1 working day
Request	Add a user, change a role, change a label, add a karigar rate	Within 2 working days

- **Hours:** Monday to Saturday, 10:00 to 19:00 IST, excluding national holidays. **Contact:** team@plotarmour.in or +91 87440 69597. **Escalation:** Shubhankar Rakshit, CFO.
- Included each month: up to **4 hours** of configuration work (users, roles, labels, rates, small report changes). Larger work is a change request (section 9).

05 Backups and restore

- We take a backup of Stylified's database and files **every day** and keep them for at least **30 days**.
- Before go-live we **rehearse a restore** on Stylified's workspace and show you the result. It is one of the acceptance criteria in document 2.

- If data is lost or damaged, we restore from the latest good backup on request, normally within 2 working days. A restore returns the workspace to the time of the backup, so entries made after it must be entered again.
- A correction to a wrong entry never needs a restore: entries are corrected by reversal and both rows stay.

06 Your data

- **It is yours.** Everything Stylified enters (lots, bundles, karigars, wages, photographs, notes) belongs to Stylified. We use it only to run the service for you and to support you.
- **Export at any time.** On request we give you all records as CSV and all files in their original form with an index, within 5 working days, at no extra charge.
- **When the service ends.** We keep your data for 30 days so you can export it, then delete it from the live system and, on your request, confirm the deletion in writing. Backups age out within a further 30 days.
- **Support access.** Our staff open your workspace only to support you; each such session is recorded in your own audit trail and time-limited.

07 Security

- Each company's data is separated by the database itself, not only by the application, and the platform refuses to run if that separation is switched off.
- Every action is checked against the user's role on the server. Every entry records who made it and when. Entries cannot be edited, only reversed.
- Traffic is encrypted. Passwords are held by the sign-in system, not by Verity. Secrets are kept in the hosting environment, never in code.
- If we confirm that Stylified's data has been exposed to someone who should not see it, we tell you without undue delay and within 72 hours of confirming it.

08 Ownership of the software

- Verity, and everything built inside it for this project, remains the property of PlotArmour. Stylified receives the right to use it during the term, for its own business.
- General parts we build (for example a better supervisor screen) may be reused for other customers. Stylified's data, its rates, its rules and anything marked confidential are never shared.
- If Stylified later wants its own copy of the code, that is a separate agreement and a separate price.

09 Changes and what is out of scope

- The MVP scope is fixed by document 2. Anything else (a new screen, a new report layout, an integration, a Phase 2 item) needs a written **change request** with a price and a date, approved by Stylified before work starts.
- Delays caused by late decisions, late data or late testing from Stylified move our dates by the same time.

10 Confidentiality

Each side keeps the other's non-public information confidential, uses it only for this service, and returns or deletes it at the end. We are happy to sign a short mutual confidentiality agreement before Stylified shares its price lists, rates or customer details.

11 Liability and law

- We take care to run the service well, but we cannot promise that it is free of every fault. Our total liability for any claim under this service is limited to the monthly fees Stylified paid in the 3 months before the claim.
- Neither side is liable for indirect loss, such as lost profit, or for events outside its control.
- These terms are governed by the laws of India, and the courts at Delhi have jurisdiction. Both sides try first to settle any dispute by talking to each other.

This document is a draft prepared by PlotArmour. It is not legal advice. Both sides should have the final text reviewed before signing.

Who we are, and what Verity is

This document states only facts the company has supplied. It makes no claim about clients, references or credentials beyond those listed.

01 Company

NAME	PlotArmour
REGISTERED ADDRESS	31/44 St 3, Block 17, Vishwas Nagar, Delhi, India, 110032
GSTIN	07TQDPS9711L1ZT
PHONE	+91 87440 69597
EMAIL	team@plotarmour.in

PlotArmour owns and develops **Verity**, an operations platform for service and manufacturing organisations.

02 Why Verity suits Stylified

Verity is a modular platform: the same foundation (data isolation per company, role-based permissions, audit trail, append-only ledgers, approvals, notifications) carries every module, so new roles, stages and users are added without redeveloping it. Stylified's needs are a piece-rate cycle with careful counting and honest money, which is what the piece-rate module on that foundation does.

CAPABILITY	EXISTS IN VERITY TODAY	BUILT OR CONFIGURED FOR STYLIFIED
Per-company data isolation, role and permission model, audit trail	Yes	The four Stylified roles
Lots, numbered bundles, bilingual slip with QR	Yes (tested; run on fictional data)	Stylified's stages, labels and numbering
Issue and return with good, rejected, rework and short; rework loop; wage basis; advances, deductions, payments; owner dashboard and reports	Yes (tested; run on fictional data)	Stylified's karigars, rates and wage bases
Approvals, notifications, file storage for photographs	Yes, as platform services	Connected to the piece-rate screens
Supervisor screens, stage assignment, manager approvals inbox	No	Built in this project
Hindi and English labels on entry and supervisor screens	Slip only	Built in this project

CAPABILITY	EXISTS IN VERITY TODAY	BUILT OR CONFIGURED FOR STYLIFIED
Fabric ledger, twelve-category costing, packing and dispatch, split and join	No	Phase 2, quoted separately

03 Experience

PlotArmour has completed **10+ past projects, with values from ₹1 lakh to ₹20 lakh**. We do not claim, in this document, previous deployments in garment manufacturing or piece-rate payroll. The piece-rate module is our own product, built from your requirement sheet and tested against its own worked examples. Further detail on past work can be discussed under a confidentiality agreement (document 3, section 10).

04 Leadership, teams and support

NAME	ROLE	BASED IN
Divyom Sharma	Co-Founder & CEO	Delhi
Nakshatra Aggarwal	Co-Founder & CEO	Edinburgh, UK
Shubhankar Rakshit	CFO	Delhi
Ayushmaan Gaur	COO	Chennai

The people and allocation for this project (project management, build, testing and go-live) are confirmed in writing at kickoff.

Support and escalation: team@plotarmour.in or +91 87440 69597, on the hours in document 3, section 4.
Escalation contact: Shubhankar Rakshit, CFO.

05 How a Verity workspace feels

One system, every role

The owner, the manager, the supervisor and the munshi use the same product with different screens. What each can do comes from their role, checked on the server.

Honest numbers

Good, rejected, rework and short are kept apart and never mixed. Every figure on a dashboard is worked out from the entries behind it, so a number can always be traced to the entry that made it.

Made for a phone on the floor

Supervisor screens are designed for a phone first: large touch targets, counting with plus and minus, a photograph from the camera.

Dark and light

Every screen works in a dark and a light theme, so it is comfortable in a bright cutting room and on an evening shift.

06 Demonstration

We can show the existing piece-rate module on fictional garment data at your premises or remotely, and we will say clearly which parts exist today and which are built in this project. The demonstration script is in document 2, section 9.

07 Confidentiality

We will sign a mutual confidentiality agreement before Stylified shares sensitive information, and we treat your requirements, rates and business rules as confidential. Support access to your workspace is recorded in your audit trail. At the end of the service we delete or return Stylified's material we hold, as set out in document 3.

How it is built

For Stylified's owner and for anyone you ask to review the solution. It says what exists, what is built in this project, and where we are still working.

01 Overview

Stylified gets its own workspace on Verity's hosted platform. The workspace is a set of screens and rules for the piece-rate cycle, on top of a shared foundation that provides sign-in, roles, an audit trail, files, notifications and company isolation.

EXPERIENCE	Web application for desktop, tablet and phone, dark and light themes. Supervisor screens are designed phone-first. Hindi and English labels on entry and supervisor screens.
PIECE-RATE MODULE	Lots, bundles, stages, karigars and rates, issues and returns, rework, shortages, wages and money, approvals, day close, reports. Every change is a *command* with its own checks; every screen reads through a *query*.
PLATFORM FOUNDATION	Company isolation, identity and memberships, roles built from permissions, an audit trail, an event log, file storage, notifications, numbering, configuration.
DATA AND HOSTING	A relational database with row-level security forced on every Stylified table, file storage, application hosting in an Indian region, backups.

02 Hosting

PART	WHERE AND HOW
Application	Hosted serverless application, deployed to the Mumbai region (configured in the deployment settings)
Database	Managed PostgreSQL in the Mumbai region, reached through a connection pooler in transaction mode. The application connects as a restricted role that cannot bypass row-level security
Files	Object storage with the same company isolation; used for photographs
Sign-in	The platform's identity service; passwords never reach Verity's own tables
Environments	A demonstration workspace with fictional data and Stylified's own workspace are separate tenants. Nothing is shared between them

PART	WHERE AND HOW
Deployment shape	Verity's shared hosted deployment (one application and database for many companies, each isolated as in section 3). A dedicated instance on Stylified's own Vercel and Supabase accounts is **not part of this solution**: see below

If Stylified later wants its own accounts

Running Verity on a customer's own Vercel and Supabase accounts is feasible but not yet built or validated. Our research lists what must be done first: scripting the creation of the restricted database role the application connects as, a scripted first-operator and first-company setup on a fresh Supabase project, a scheduled-jobs setup per instance, separate file and database backups, a release and migration channel for more than one instance, and a support model without a shared console. A rehearsal on throwaway accounts must pass before any real data moves. Provider plans must allow business use (Vercel Pro and Supabase Pro are the minimum; free plans are not suitable). We will quote the move separately once this is done; until then the isolation, backup and security statements in this document describe the shared hosted deployment only.

Provider names and plans can change over the life of the service; the data stays in an Indian region and the isolation rules below do not change.

03 Company isolation

- Every Stylified record carries the company it belongs to. The database itself refuses to return or accept a row for another company: row-level security is **forced** on each table and the company is set for each request from the signed-in user's verified membership, **never from anything the browser sends**.
- If no company is set, a query returns nothing and a write is rejected: isolation fails closed.
- The platform checks at startup that its database role is one that cannot bypass these rules, and refuses to run otherwise. An automated test proves that one company cannot read another's data.

04 Roles and permissions

- A permission is an action on a kind of record within a scope (for example "issue" on a piece-rate entry for the company). A role is a named set of permissions. There are no hard-coded role names in the code, so changing a role is a setting, not a release.
- The four Stylified roles (Owner, Manager, Supervisor, Munshi) and their matrix are in document 2, section 4.
- The server checks the permission for every command and every query. Hiding a button is only a convenience; it is never the control.
- **Supervisor stage scope.** The platform's scope list stays as it is. A supervisor's assigned stages are held as a small record in the piece-rate module, and the issue and return commands refuse a supervisor acting on a stage that is not theirs. This is tested with a second supervisor.

05 The data model

RECORD	WHAT IT HOLDS	RULES
Stage	A step in the line, in order (pasting, collar and cuff, stitching, button and kaj, finishing and press)	Stages are Stylified's data; the order is frozen once work exists
Lot	Number, name, design, fabric type, planned pieces, dates, status	Numbers are gapless and never reused; a closed lot is locked
Bundle	Number B-0001 onward, net pieces, size-mix note, the lot it belongs to	Numbers are gapless per workspace
Karigar or unit	Name, kind (in the factory or outside), contact, active	Retired, never deleted
Rate	Rupees per piece for a karigar at a stage, the wage basis, the date it applies from	History is kept; each return takes a snapshot of the rate used
Entry (issue or return)	Bundle, stage, karigar, pieces, due date, and for a return the split into good, rejected, rework and short	Append-only. A database check makes the four parts sum to the pieces returned. Corrections are reversals
Payment	Advance, recovery, deduction or payment, amount, mode, reference, reason	Append-only; amounts are whole paise, so there is no rounding drift
Stage assignment NEW	A supervisor and a stage	Set by the owner; checked by the commands
Approval request NEW	Kind (deduction, write-off, hold, close), subject, amount or pieces, requester, state, decision and reason	Decided once; above-limit requests need the owner
Evidence photo NEW	A file reference on a rejected or rework entry; a cover photo reference on a lot	Stored with company isolation; never a public link
Day close NEW	Supervisor, date, summary figures at the time, a note	Frozen once submitted

How the figures are made

Nothing on a dashboard is typed in. Pieces out, pieces waiting, good, rejected, rework, short, days at a stage, wages and balances are all computed from the entries and payments by one piece of logic, which is covered by automated tests that use the worked examples from your requirement sheet (for example 100 pieces issued, 94 good, 2 rejected, 1 rework, 2 short and 1 still open; and ₹48,000 over 960 good pieces is ₹50 a piece). A figure on a report always agrees with the entries it is built from.

06 Audit and corrections

- Every command records who did it, when, from which role, and what changed, in an audit trail the owner can read.
- Entries, payments and rate history cannot be updated or deleted by the application: a database rule rejects both. A wrong entry is cancelled by a **reversal** with a reason; the original and the reversal both stay visible.
- A reversal that would leave a later stage with more pieces than it received is refused.

07 Photographs

- A photograph is uploaded from the phone camera or a file, checked for type and size, stored in the company's isolated storage, and shown through a short-lived link only to users who may see the record.
- Pictures are resized for the screen so lists stay fast.

08 Backups and recovery

- A daily backup of the database and files, kept for at least 30 days, is part of the service (document 3, section 5). The mechanism (the hosting provider's backups plus our own nightly export) is configured and a **restore is rehearsed** on Stylified's workspace before go-live; that rehearsal is an acceptance criterion.
- Because corrections are reversals, a restore is needed only for loss or damage, not for ordinary mistakes.

09 Security summary

CONCERN	CONTROL
One company seeing another's data	Forced row-level security in the database; company taken from the verified membership; tested
A user doing more than their role allows	Server-side permission check on every command and query; tested
Altering history	Append-only ledgers enforced by the database; reversal only
Staff access to your data	Only to support you; each session recorded in your audit trail and time-limited
Secrets	Held in the hosting environment, never in code or in the database
Public links	The bundle QR opens a sign-in screen, then the bundle. It carries only the bundle's address, no figures or names

10 Speed

We measured the local build: a page made about 10 to 16 database calls, mostly shared overhead from sign-in and navigation rather than the page itself. We have already removed the repeated identity lookups (the first of several steps), added an instant top progress bar and press feedback on every card and button, and replaced the lone loading spinner with a page-shaped skeleton. The remaining planned steps are folding the layout's

queries into one, caching each user's navigation and permissions for about a minute, and narrowing the dashboard's queries as history grows. We will report measured times on Stylified's workspace before go-live, not estimates.

11 Testing

LAYER	WHAT IS COVERED
Logic tests	28 tests on the piece-rate calculations, using the requirement sheet's own examples
Database tests	23 tests against a real database: reconciliation, over-issue and over-return refusals, rework pool, the three wage bases, payment guards, reversal rules, concurrent entries, append-only rules, the owner role refused every write, company isolation
Platform tests	Identity, membership, tenant isolation and permission tests that every capability inherits
Browser checks	Every screen opened in dark and light on desktop and at 390 px, with the demonstration data, before go-live; defects are logged and fixed
Acceptance	The ten criteria in document 2, section 10, run with Stylified

12 Where things stand, and what follows

- The piece-rate module is built and proven on demonstration data in our test environment; it moves onto Stylified's own workspace and people at kickoff.
- The supervisor, approval, photograph and bilingual screens are the build of this project, and each passes its tests before you see it.
- Speed on the hosted service is measured on your workspace during the week-three checks; the figures above are from a local build.
- Offline use, SMS or WhatsApp alerts, barcode scanning and the Phase 2 modules come after go-live, quoted separately.
- A deployment on Stylified's own Vercel and Supabase accounts is a later option, offered after a full rehearsal.
