

verity

From the fabric roll to the ready garment. One calm system.

A Verity workspace built around how Stylified works: rolls in, lots cut, bundles scanned from hand to hand, every count agreed by both sides, karigars paid by the piece, and the cost of every lot known.

PREPARED FOR

PROPOSAL

25 October 2026

DOCUMENT

1 of 6

Know where every roll, bundle and rupee is.

Verity gives Stylified a living picture of the factory: how much fabric is on the shelf, which lot it went into, which bundle is with which karigar, what came back good, what is short and who answers for it, what is late, what is owed, and what each lot really cost. All of it is worked out from the entries your team makes, never typed in twice.

OXFORD FORMAL

WINTER FLANNEL

SUMMER POPLIN

EXPORT CHECK

ONE WORKSPACE

6 roles

Owner, manager, supervisor, munshi, store and cutting master, each with their own screens.

SCAN, DO NOT TYPE

QR on every roll and bundle

A phone camera opens the roll or bundle and shows the one thing to do next.

READY QUICKLY

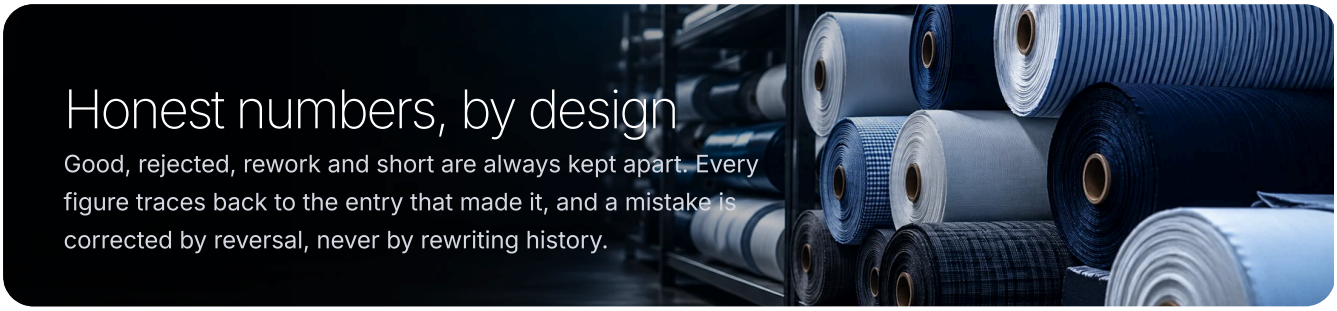

~4 weeks

From kickoff to your own live workspace, with a test lot on your floor in week two.

01 What changes for each person

WHO	BEFORE	WITH VERITY
Owner	Asking around to learn where a lot is, what it cost and who is waiting to be paid	One factory screen: where every piece is, what is late, what is owed, the cost per good piece of every lot, and a change history of who did what
Manager	Deductions and write-offs argued from memory	An approvals inbox with the facts and a photograph, decided from a phone, within limits the owner sets

WHO	BEFORE	WITH VERITY
Supervisor	Registers, counts that do not add up, no proof of a defect	Scan a bundle, pick the karigar, count with plus and minus. The receiver's count is the one that counts, and a shortage opens a case on whoever held the pieces
Munshi	Typing the same figures into more than one place	Enter once, in Hindi or English, and print a bilingual slip with a QR for every bundle
Store and cutting master	Rolls measured and remembered, fabric used worked out afterwards	Receive rolls with a printed label each, cut a lot from chosen rolls in one step, and see what is left on every roll

Honest numbers, by design

Good, rejected, rework and short are always kept apart. Every figure traces back to the entry that made it, and a mistake is corrected by reversal, never by rewriting history.

02 What is in your workspace

Fabric rolls

Receive rolls by invoice, each with its own number and a printed QR label. Stock by fabric, a balance on every roll, a warning when a fabric runs low, a warning when the same supplier invoice is entered twice, and opening stock on launch day.

Lots, rate card and cutting

Plan a lot, set the rate per piece for each stage on the lot's own rate card (a stage can be skipped for a lot), and cut it from the chosen rolls in one step. Numbered bundles, B-0001 onward with no gaps, each with a slip: full size or a small sticker for the tie, printed together.

Give out and take back, by scan

Scan a bundle, pick the karigar, confirm the count, and a challan prints for the worker. Taking back is counted as good, rejected, rework and short. The receiver's count is the truth, and the supervisor who recorded each handover answers for it.

Cases and charges

Pieces that go short open a case on the worker who held them and raise a charge request for the lost pieces. Nothing is deducted silently: the manager or the owner decides within their limits, and the decision, who made it and why stay on the case.

Wages, advances and balances

The lot's rate times the accepted pieces. Advances, recoveries, deductions with a reason, payments with mode and reference, and an opening balance for what was owed before Verity. Every karigar has a clear account.

Lot costing

Fabric at the roll's invoice rate, wages, and the cost categories you choose (thread, printing, packing and more), less charges recovered. Cost per good piece for every lot, and a shared bill split by pieces cut.

Team

Add a person in one sheet with their role and stages. Each karigar has a profile and a supervisor, so a supervisor's list shows their own people. Switch someone off when they leave; their history stays. People without an email sign in with a username.

Ready stock

The garments that finished the last stage, less what has gone out. Enter the stock already on the shelf as opening stock, take stock out as sold, dispatched or a sample, and correct a count with a reason. Every movement is on a ledger you can reverse and download.

Routes that fit the factory

Mark a stage required or optional. A lot can skip only an optional stage, so a shirt without a collar and cuff follows its own route while every other lot keeps the full one. Each person opens on the page their work is on.

Reports and records

Reports led by graphics with the table folded below, each with Excel, CSV and Print or PDF. A change history of who did what and when. Defect photographs taken on the phone and attached to the entry.

Hindi and English: the floor screens, the daily entry and every slip are bilingual, chosen on each phone. The owner and office screens are in English today; a Hindi office interface is one of the next steps in section 05.

03 Your investment

The software and everything in document 2 are the same on both options. What differs is how you pay for it: more once and less each month, or less once and a little more each month.

OPTION A · OWN IT

₹90,000 + GST, once

₹8,500 + GST a month

The lowest running cost. Cheaper than Option B in total from the 19th month.

OPTION B · START LIGHT

₹25,000 + GST, once

₹12,000 + GST a month

The smallest amount to begin with. The monthly amount is a little higher.

TOTAL OVER TIME, BEFORE GST	OPTION A	OPTION B
At go-live, the one-time amount	₹90,000	₹25,000
After 3 months	₹1,15,500	₹61,000
After 12 months	₹1,92,000	₹1,69,000
After 24 months	₹2,94,000	₹3,13,000
After 36 months	**₹3,96,000**	**₹4,57,000**

WHAT THE MONTHLY AMOUNT COVERS	IN PRACTICE
Server	Hosting in an Indian data-centre region, database, photograph storage, security patching and monitoring. You pay no separate hosting bills
Maintenance and support	Fixes, small configuration changes, user and role changes, support on working days, daily backups and a rehearsed restore
Subscription	The right to use Verity, and every improvement we release to it

All amounts are plus GST at the prevailing rate. The one-time amount is invoiced half at kickoff and half at go-live; the monthly amount begins at go-live. The invoice amounts for each option are in document 3.

Where it runs, and where it can go

Your workspace is hosted by PlotArmour in an Indian region, with your data isolated from every other customer. When you want it, we can quote a move to **your own Vercel and Supabase accounts, in your name**, with your hosting bills kept inside the same monthly amount. We will offer it once it has been through a full rehearsal, and until then you can export all your data whenever you ask.

04 The road to go-live

WHEN	WHAT HAPPENS
Day 0	Kickoff call: confirm the build decisions (document 2), the list of people and the stages, and the sign-in for people without an email
Week 1	Your own workspace is set up: roles, people, karigars (pasted from your list), stages and rates, opening fabric stock and opening balances, challan heading. Supervisors are shown the phone screens
Week 2	**A test lot runs on your floor**: cut, scan, give out, take back, challan, case, wages. Paper runs beside it
Week 3	Your feedback, fixes, a restore rehearsed in front of you, training in Hindi and English for each role

WHEN	WHAT HAPPENS
Week 4	Go-live: lots move onto Verity stage by stage, with paper kept as a control until the numbers agree

05 What comes next

When Stylified is ready, the same workspace grows with it, each step quoted on its own and agreed in writing first:

Join or link lots	With cost re-allocated by pieces or an approved percentage, and the source lots kept intact
Hindi on the office screens	A language switch for the owner, manager and munshi screens, reports and errors
Packing and dispatch	Packing, packets, parties and transport references (outside release one by your own requirement sheet)
Alerts to the phone	A daily summary and challans sent by WhatsApp or SMS, once a provider is chosen
Floor extras	Leave and cover for supervisors, a roll stock-take by scanning, label-printer support, a print queue that remembers which slips were printed
Accounts and parties	A Tally voucher export, a supplier and party master, a GST job-work challan for outside units
More	Style and size master with buyer orders, offline scanning for weak signal, a second unit

06 Getting started

- Tell us "go" and name the person who decides for Stylified, and the person who answers for the floor.
- Share your list of people and which supervisor looks after which stages, and your karigar names (a pasted Excel list is enough; rates can follow).
- Give each supervisor a phone with a camera and internet; the workspace runs online.
- Tell us your printer and the sticker size you would use for the bundle tie.

Next step: reply to team@plotarmour.in with "Go ahead" and the option you prefer, and we will send the kickoff date. We would be glad to walk you through the workspace on a call first.

Service starts at go-live with an initial term of three months, then continues month to month; the full terms are in document 3. This proposal is valid for 30 days from 25 October 2026. PlotArmour, 31/44 St 3, Block 17, Vishwas Nagar, Delhi 110032 · GSTIN 07TQDPS9711L1ZT · team@plotarmour.in · +91 87440 69597.

verity

Scope, screens and acceptance

What is in the Stylified workspace, who sees which screen, how the demonstration runs, and how we agree it is done.

What we build, and for whom

The workspace runs a real lot from the fabric roll to the ready garment, with every handover counted by both sides, money and quality kept honest, and the cost of the lot known. It is built from your requirement sheet (version 2.0, 23 October) and from the working chat with Ayushmaan Gaur on how the floor actually moves.

01 The flow, in seven steps

#	STEP	WHAT HAPPENS
1	Receive rolls	Each roll gets a number and a printed QR label: fabric type, quantity, supplier, invoice. A repeated invoice is warned before it is saved
2	Make a lot	A design, a planned quantity, and a rate card: what each stage pays per piece. A stage can be skipped for a lot
3	Cut	Choose the rolls, say how much fabric went in and how many pieces came out. Verity makes the numbered bundles, each with a slip and a QR
4	Give out	Scan a bundle, pick the worker, confirm the count. A challan prints for the worker
5	Take back	Scan the bundle and count what returned: good, rejected, rework, short. **The receiver's count is the truth.** A shortage opens a case on the worker who held the pieces and raises a charge request
6	Next stage	Good pieces flow to the next stage in the order you set. The last stage's good pieces are ready garments
7	Pay	Wages come from the lot's rate card times accepted pieces. Advances, deductions, payments and the balance live on each worker. The lot's cost is fabric plus wages plus other costs, less charges recovered

The system ends at ready garments. Dispatch is outside release one, as your own sheet says (FR-020).

02 What the demonstration has to prove

TO WHOM	THEY SHOULD LEAVE BELIEVING
Owner	"I can see where every roll and piece is, what is late, what I owe and what each lot cost, without asking anyone. I decide who can do what."
Manager	"Deductions and write-offs come to me with the facts and a photograph, and I can say yes or no from my phone."

TO WHOM	THEY SHOULD LEAVE BELIEVING
Supervisor	"I scan, I count, the challan prints. My screen is my stages and my karigars. I cannot make a counting mistake without being told."
Munshi, store, cutting master	"I enter once, in Hindi or English, and the label, slip and challan are printed. Nothing is typed twice."

03 Scope

These parts are built and covered by automated tests (more than 85 tests on the piece-rate rules, the floor, fabric and costing, team management and company isolation, besides the platform's own tenancy and permission tests). They have been opened in a browser on a demonstration workspace with fictional data. **On your workspace they run from week one.**

ITEM	WHO IT IS FOR	STATUS
Fabric: receive rolls, QR labels, roll balances, low-stock warning, duplicate invoice warning, opening stock	Store, Munshi, Manager, Owner	BUILT
Lots, lot rate card with skippable stages, one-step cut from chosen rolls, numbered bundles	Munshi, Cutting master, Manager, Owner	BUILT
Slips and labels: bundle slip full or sticker size, choose which to print, print the day's challans together, print shelf roll labels together	All who print	BUILT
Scan with the phone camera (or a hand scanner, or a typed number): opens a bundle, roll, lot or challan and shows the move open to this person now	Supervisor, Store, Cutting master	BUILT
Give out with the karigar's count and a printed challan; take back with the receiver's count and the factory's own reasons	Supervisor, Munshi, Manager	BUILT
Cases for short pieces, charge requests, approvals within limits the owner sets, a change history	Supervisor, Manager, Owner	BUILT
Wages, advances, recoveries, deductions, payments, opening balance owed, karigar account	Munshi, Manager, Owner	BUILT
Lot costing with shared bills, cost per good piece, a refusal of costs that would be counted twice	Manager, Owner	BUILT
Team: people as cards by role, add a person, change role and stages, reset a password, switch off and on, six role presets	Owner	BUILT
Set up the factory: a journey from the challan heading to the first lot, worked out from what exists, each step opening the real screen	Owner, Manager	BUILT
Who holds what: open pieces by supervisor, karigar and bundle, with how long and what is late	Owner, Manager, Supervisor	BUILT
Karigar profile, supervisor per karigar, a pasted-from-Excel karigar list	Manager, Owner	BUILT

ITEM	WHO IT IS FOR	STATUS
Reports led by graphics with Excel, CSV and Print or PDF; factory dashboard; ready garments	Owner, Manager, Munshi	BUILT
Ready stock inventory: what production made ready, opening stock, stock out (sold, dispatched, sample), count corrections with a reason, a reversible ledger	Store, Munshi, Manager, Owner	BUILT
Required and optional stages: a lot can skip only an optional stage; each role opens on the page its work is on	Owner, Manager	BUILT
Photographs: defect photos on rejected or rework entries, lot pictures set up with you	Supervisor, Munshi, Owner	BUILT
Hindi and English on the floor screens, daily entry and every slip	Supervisor, Munshi	BUILT
Your own workspace: roles, people, stages and rates, opening balances, challan heading	All	WEEK 1
A test lot on your floor, training in Hindi and English, a restore rehearsed in front of you, go-live	All	WEEKS 2 TO 4

04 Roles and what each can do

Permissions are checked on the server for every action, never only by hiding a button. "Own" means only the stages the owner has assigned to that supervisor, and the karigars set under them or under nobody yet. A role is only a list of permissions, so Stylified can change any of them on the Roles screen.

ACTION	OWNER	MANAGER	SUPERVISOR	MUNSHI	STORE	CUTTING
See the factory dashboard and lots	Yes	Yes	Yes, no money	Yes	Lots, bundles	Lots, bundles
See wage rates, wages and balances	Yes	Yes	No	Yes	No	No
Receive rolls, print roll labels, move rolls	Yes	Yes	No	Yes	Yes	See and move
Set a lot's rate card	Yes	Yes	No	Yes	No	No
Cut a lot, print slips	Yes	Yes	No	Yes	No	Yes
Take stock out, correct a ready stock count	Yes	Yes	No	Yes	Yes	No
Give out, take back, rework	Yes	Yes	Own	Yes	No	No
Open a case, raise a shortage	Yes	Yes	Own	Yes	No	No

ACTION	OWNER	MANAGER	SUPERVISOR	MUNSHI	STORE	CUTTING
Write off a shortage; record a deduction	Yes	Approves within limit	Requests	Requests	No	No
Record an advance, recovery or payment	Yes	Yes	No	Yes	No	No
Reverse a wrong entry (with a reason)	Yes	Yes	Own, same day	Own, same day	No	No
Hold or complete a lot	Yes	Yes	Request a hold	No	No	No
Close a lot	Yes	Approves within limit	No	No	No	No
Lot costing and cost reports	Yes	Yes	Never	Yes	No	No
Change history	Yes	Yes	No	No	No	No
People, roles, stage assignment, limits, production settings	Yes	View	No	No	No	No

The limits a manager may approve alone (a rupee amount for deductions, a number of pieces for write-offs and lot closes) are set by the owner on the Team screen; above them only the owner can approve. Nobody can decide their own request. Your sheet's role matrix is confirmed with Stylified at kickoff.

05 The screens

Supervisors work standing on the floor with a phone, so their screens are phone-first: one task per screen, large touch targets, counts entered with plus and minus controls, and no wage figure anywhere. On a desktop they use the same layout, wider.

Scan

SUPERVISOR, STORE, CUTTING MASTER · PHONE

- A viewfinder. Point the camera at a slip, a roll label or a challan, or type the number, or use a hand scanner.
- A card for what was scanned, with its one next action for this person: give out, take back, or open the roll.

My floor

SUPERVISOR · PHONE AND DESKTOP

- The stages this supervisor looks after, and today's date. A gauge of pieces in these stages: out with karigars, waiting, rework, short.
- "Late and due today": one card per open issue with the bundle, karigar, pieces still out and due date.
- Alerts for these stages, tappable: late returns, open shortages, requests waiting.

Give out and take back

SUPERVISOR · PHONE FIRST

- Give out: pick the karigar (from the supervisor's own list), confirm the count they accept, set a due date. The wage basis defaults to the karigar's and can be changed for one job. A challan prints.
- Take back: enter good, rejected, rework and short with plus and minus. A live line reads "accounted for 96 of 98, 2 will stay open" and turns red if the total is more than is out; Save stays disabled.
- Rejected and rework need a reason from your own list, and a photograph can be taken right after saving.
- Saving writes one entry that cannot be edited, only reversed with a reason.

Cases

SUPERVISOR, MANAGER, OWNER

- Every shortage as a case, oldest first: who held the pieces, how many, which bundle, who recorded it, what was decided, by whom and when.
- A case opens a charge request for the lost pieces. It is decided by the manager or owner within their limits; a piece that turns up later is corrected by reversal.

Day close

SUPERVISOR → OWNER AND MANAGER

- A one-screen summary of the day for these stages: given, taken back, good, rejected, rework, short, and what is late.
- A short handover note in Hindi or English. Submitting freezes the summary for the owner and manager to read.

Manager and office screens

Approvals

`MANAGER, OWNER`

- One inbox: deduction requests, write-offs, lot hold and close, charge requests. Each shows the facts and the photograph, and two buttons: approve, and decline with a reason.
- Anything above the manager's limit is shown but only the owner can approve it.

Fabric

`STORE, MUNSHI, MANAGER, OWNER`

- Stock by fabric with a balance ring, roll cards with what is left on each, a flag on any fabric under the level you set. Receive many rolls in one sheet; print every label together.

Lots

`MUNSHI, CUTTING MASTER, MANAGER, OWNER`

- A journey from rolls to cut, stages and ready; the rate card; one-step cut with the slips; the bundles; the lot's cost.

Ready stock

`STORE, MUNSHI, MANAGER, OWNER`

- One card per lot or opening line: what production made ready, what has gone out, count fixes, and the balance in stock, with the bundles it sits in. A card opens the lot.
- Stock out (sold, dispatched, sample, with the party and the invoice or challan number), opening stock, and a count correction that needs a reason. The screen and the server both refuse more than is in stock.
- Every movement on a ledger, newest first, each one reversible with a reason, and downloadable to Excel.

Karigars

`MANAGER, MUNSHI, OWNER`

- People cards with what each holds, what is owed, who looks after them. A profile (joined, ID note, emergency contact), rates per stage, and the account: wages, advances, deductions, payments, opening balance. Import a whole list pasted from Excel.

Team and production settings

OWNER

- People as cards by role: add a person in one sheet, change a role, assign stages, set a new password, switch off. Manager limits. The roles and what each is for.
- Stages and their default rates, the charge for a lost piece, reasons in two languages, the low-fabric level, the challan heading.

Who holds what

OWNER, MANAGER, SUPERVISOR

- One card per supervisor with the karigars set under them, then those not yet under anyone. Each karigar shows the pieces held, how many days the oldest has been out, and the bundles, with the late ones marked. No money appears.
- The answer to "if a count is wrong tomorrow, whose hands were the pieces in?"

Set up the factory

OWNER, MANAGER

- The order a new workspace is made ready in: the challan heading, stages and rates, roles, people, karigars, who looks after whom, fabric on the shelf, opening balances, the first lot.
- Each step is ticked by what exists, never by hand, and opens the screen that does the work.

Reports and change history

OWNER, MANAGER, MUNSHI

- Lot status, where every bundle is, work in hand, wages, quality, production by stage, costing, ready garments. Each with Excel, CSV and Print or PDF, and totals that match the screen.
- Change history: who did what and when, newest first, each line opening its record.

06 The decisions we made from your sheet

Your sheet left questions open. We decided each from the sheet's own suggested default, and each can be changed by configuration, not by a rebuild. **Please confirm or change them at kickoff.**

ID	DECISION	STATE
D-01	Bundle quantity is free per bundle; no mandatory size split; an optional size-mix note	BUILT
D-02	Wage basis is set per karigar and stage and can be overridden on one issue: issued, returned or accepted good. A lot's rate card comes first, then the worker's own rate, then the stage default	BUILT

ID	DECISION	STATE
D-03	No automatic wage deduction for short or rejected pieces. A charge request goes to the manager or owner	BUILT
D-04	An advance is recovered only by an explicit entry of a chosen amount, never silently	BUILT
D-05	Each cost category is a separate entry; a cost named like fabric, wages or a stage is refused because those are already counted	BUILT
D-06, D-07	The labels "Thread" and "Side Feed Up" are data you can change without code (cost categories, in two languages)	BUILT
D-08	A movement names a stage and a karigar, unit or place; no separate floor or table master	BUILT
D-09	Joining or splitting lots allocates cost by pieces or an approved percentage that always sums to 100. Bundles can be split and joined at the cutting table today; lots are a next step	NEXT STEP
D-10	Fabric inward takes date, rate and amount as optional; a lot's fabric cost is what was used times the roll's invoice rate	BUILT
D-11	Online-first web app; no offline mode in this release	DECIDED
D-12	Opening fabric stock and each karigar's opening balance owed or advance given are entered on launch day. Opening ready garments are entered as opening stock on the Ready stock screen	BUILT
D-13	Owner full; manager limited by approval limits; supervisor scoped to assigned stages and karigars (section 4)	BUILT
D-14	Dispatch is outside release one, as your sheet says; it can be added later as a scope change	OUT OF SCOPE
D-15	Hindi and English: the floor screens, the daily entry, every slip, the reasons and the cost categories are bilingual now. Your sheet (FR-002) says "all core screens"; the owner, manager and munshi office screens, reports and error messages stay in English in this release and a Hindi office interface is quoted as the first next step. Please confirm at kickoff	NEXT STEP

07 After go-live: what is quoted separately

ITEM	WHY IT WAITS
Join or link whole lots, with cost re-allocated	Rewrites cost across lots; needs your approval rules first
A Hindi interface on the office screens, with a language switch	Touches every office screen, report and error; the floor, daily entry and slips are bilingual already
Packing, packets, parties, dispatch	Outside release one by your sheet; needs parties and transport references

ITEM	WHY IT WAITS
WhatsApp or SMS: a daily summary, the challan, the wage slip	Needs a provider you choose and who pays it
Leave and cover for supervisors, a roll stock-take by scanning, label-printer support, a print queue	Each is a separate piece of work
Tally voucher export, supplier and party master, GST job-work challan for outside units	Needs your accountant's format
Style and size master with buyer orders; offline scanning; a second unit	New modules; offline only if the test lot shows signal drops
Move of the workspace to Stylified's own Vercel and Supabase accounts	Needs install steps we have not yet scripted or validated; quoted once validated

08 What changes under the hood

For readers who want to know what "customization" means in practice. Detail is in document 5.

- **Roles.** Six roles are made from permissions (an action on a record type within a scope), installed once per workspace and editable. No role name is fixed in the code.
- **Stage and karigar scope.** A small record links a supervisor to the stages they look after, and a karigar can be set under a supervisor. The commands that give out and take back check both, for every caller.
- **Rate card.** A rate per stage for each lot, taken first; then the worker's own rate; then the stage's default. The rate used is copied onto each entry, so a later change never rewrites history.
- **Rolls and cost.** A roll carries its invoice rate. Fabric used by a lot is recorded when it is cut, and the lot's cost is built from the records, never typed.
- **Cases and approvals.** A shortage opens a case on the worker who held the pieces. Approving applies the ordinary change through the same rules as any other user.
- **Photographs.** A defect photograph is platform evidence about the entry, uploaded in two steps and checked before it is recorded.
- **Bilingual labels.** A label catalogue for the floor screens and daily entry; the language is chosen on each device and remembered there.

09 The demonstration

About fifteen minutes, on fictional data that includes the reconciliation from your own sheet (100 pieces: 94 good, 2 rejected, 1 rework, 2 short, 1 still open), one late outside unit and one lot that skips a stage. A reset command returns the workspace to this state.

#	WHO	SCENE	SHOWS
1	Store	Receive three rolls and print the labels	Roll numbers, QR labels, balance per fabric, duplicate invoice warning

#	WHO	SCENE	SHOWS
2	Munshi, cutting master	New lot, rate card with a skipped stage, cut from the rolls, print sticker slips	Gapless numbering, fabric used, slips full or sticker
3	Supervisor (phone)	Scan a bundle, give it out, take the challan from the printer	Scan, the karigar's count, the challan
4	Supervisor	Take back 98 of 100	The receiver's count, a case on the worker, a charge request, a photograph on a rejected piece
5	Supervisor	Try to take back more pieces than are out	The screen refuses, with the figures
6	Manager (phone)	Approve a charge and decline a write-off	Approvals inbox with the facts, within limits
7	Owner	Open the lot's cost and the karigar's account; download a report to Excel	Cost per good piece, wages on the lot's rate, totals that match
8	Owner	Team: add a supervisor, give stages, set karigars under them	Roles, stages, the supervisor's own list
9	Supervisor	Close the day with a Hindi note; try to open wages	The day summary; money is refused to a supervisor

10 How we agree it is done

Document 6 turns each of these into a step to run, the figures to expect and a box to tick, with the sign-off at the end.

1. All six roles can sign in, and each sees only the screens in section 4. A supervisor cannot give out at a stage that is not assigned to them, nor to a karigar who is set under another supervisor, tested with a second supervisor.
2. The reconciliation from your sheet reproduces exactly: 100 = 94 + 2 + 1 + 2 + 1 open.
3. 100 sent and 98 received shows 2 as a case on the worker who held them, with a charge request, both people recorded and the handover history kept.
4. A return that accounts for more pieces than are out is refused with the figures; a correction is a reversal, and both rows stay.
5. A rejected or rework entry accepts a photograph, and the photograph shows in the register and in the approval.
6. A deduction, charge or write-off above the manager's limit cannot be approved by the manager; the owner can.
7. A closed lot cannot be changed.
8. A roll is received with a label; scanning the label opens it; cutting a lot from rolls reduces their balances; a repeated invoice is warned.
9. A lot's cost equals fabric plus wages plus other costs less charges recovered, and a cost that would be counted twice is refused.

10. Opening fabric stock and a karigar's opening balance can be entered and reversed, and appear in the ledgers.
11. A person added on the Team screen can sign in with the role and stages given; a person switched off cannot.
12. Every report downloads to Excel and the totals equal the screen.
13. Every screen in this document opens at desktop width and at 390 px phone width, in both light and dark themes, with your data and no unrecorded defect.
14. Hindi labels show on the daily entry and every supervisor screen for a user whose language is Hindi.
15. Ready stock: opening stock is entered, stock out beyond what is in stock is refused, a count correction needs a reason, and a reversal returns the stock with both rows kept.
16. A lot can skip an optional stage but not a required one, and its pieces go on to the next stage.
17. A backup is taken and a restore is rehearsed on the Stylified workspace before go-live.

11 Schedule and risks

WEEK	WORK	CHECKPOINT
0	Kickoff, decisions, people, stages, sign-in for people without an email	Decisions confirmed in writing
1	Your workspace: roles, people, karigars, rates, opening balances; supervisors shown the phone screens	Each person can sign in and see their own screens
2	A test lot on your floor, paper running beside it	**Demonstration on your own lot**
3	Your feedback, fixes, a restore rehearsed, training	Acceptance in section 10
4	Go-live, stage by stage, paper kept as a control	Numbers on paper and in Verity agree

RISK	WHAT WE DO
The floor scans only when watched	The test lot and the paper control exist for this: every difference between paper and Verity is logged and explained before a stage moves over
Decisions or lists arrive late	Dates move by the same number of days; we say so in writing
Floor internet is weak	The workspace is online only (D-11); if it is a real problem, offline scanning is a separate quote
The wage matrix or limits differ from the sheet	They are settings, changed on screen; we confirm them in acceptance
Scope grows during the build	A written change request with a price and a date before any extra work starts

verity

Service terms

Hosting, support, backups, your data, the initial term, and how either side can end the service.

DRAFT, SUBJECT TO LEGAL REVIEW

BETWEEN

PlotArmour and Stylified

PREPARED BY

PlotArmour

DATE

25 October 2026

DOCUMENT

3 of 6

The terms, in plain language

These are the working terms for the hosted Verity service described in document 1. They are written to be read by a business owner. The wording is reviewed by a lawyer before it is signed, and any number in it can be discussed.

01 The service and the term

- **What you get.** A Verity workspace for Stylified, hosted by PlotArmour, configured to the scope in document 2, for up to **10 named users** and **one unit**. More users or units, and any new module, are priced separately.
- **Start.** The service starts on the **go-live date**, when Stylified accepts the workspace against the criteria in document 2, section 10.
- **Initial term.** The service begins with an initial term of **3 months from go-live**, billed monthly in advance, which gives us time to tune the workspace to how Stylified works.
- **After the initial term.** The service continues month to month. Either side may end it by giving **30 days' written notice** (email is enough); the last invoice covers the notice period.

02 Fees, invoices and GST

Stylified chooses one of two options before kickoff. The software and the scope are the same on both; only the way of paying differs. GST is shown at 18% for illustration and is charged at the rate in force.

ITEM	OPTION A · OWN IT	OPTION B · START LIGHT
One-time fee, before GST	₹90,000	₹25,000
GST on the one-time fee (18%)	₹16,200	₹4,500
One-time invoice total	**₹1,06,200**	**₹29,500**
Invoiced as	₹53,100 at kickoff, ₹53,100 at go-live	₹14,750 at kickoff, ₹14,750 at go-live
Monthly fee, before GST	₹8,500	₹12,000
GST on the monthly fee (18%)	₹1,530	₹2,160
Monthly invoice total, in advance from go-live	**₹10,030**	**₹14,160**

- The monthly fee covers the server (hosting, database, photograph storage, monitoring), maintenance and support, and the subscription to Verity and its improvements.
- Invoices are payable within **7 days**. GST is charged at the rate in force; PlotArmour is registered in Delhi (GSTIN 07TQDPS9711L1ZT), so IGST applies to a customer in Punjab.

- If a monthly invoice is more than **15 days** overdue, we may suspend access after 5 days' written warning. Data is kept while the service is suspended and access is restored when the invoice is paid.
- Fees for the scope in document 2 are fixed. We may change the monthly fee after the initial term with 60 days' written notice; if Stylified does not agree it may end the service under section 1.

03 Hosting and availability

- The workspace runs on Verity's hosted platform in an Indian data-centre region, with its own isolated data inside a shared, secured system. No other customer can read Stylified's records.
- We aim for the service to be available at least **99.5% of each month**, not counting planned maintenance announced at least 24 hours ahead and problems with Stylified's own network or devices. This is a target we work to, not a guarantee, and it carries no automatic refund.
- Security fixes and platform improvements are applied by us as part of the monthly fee.
- Stylified pays no separate hosting, database or storage bills. They are covered by the monthly fee.

Moving to Stylified's own accounts (an option, not part of the scope in document 2)

- Stylified may ask to move its workspace to **its own Vercel and Supabase accounts, in Stylified's name**. We offer this once we have validated that way of running Verity, and quote the move separately. We do not promise a date, and we will not move a live workspace until a rehearsal on a test copy has passed.
- While the accounts are billed to PlotArmour, the provider charges stay inside the monthly fee and it does not change. If provider charges ever rise beyond what the fee can carry, we will tell Stylified in writing with 60 days' notice before any change to the fee.
- Stylified is the account owner. It can see everything in those accounts and can revoke our access at any time; our access is recorded and limited to supporting the service. If access is revoked, we cannot support the workspace until it is restored, and the monthly fee continues for the initial term.
- Each provider's own terms apply to the accounts, including any limit on commercial use of its plans; we will choose plans that allow Stylified's business use.
- The move needs a short, announced downtime and a data check before and after. The old copy is kept for 30 days and then deleted.

04 Support

KIND OF PROBLEM	EXAMPLE	FIRST RESPONSE
Critical	Nobody can sign in, or entries cannot be saved	Within 4 working hours
Normal	A report is wrong, a screen misbehaves, a user cannot see something they should	Within 1 working day
Request	Add a user, change a role, change a label, add a karigar rate	Within 2 working days

- **Hours:** Monday to Saturday, 10:00 to 19:00 IST, excluding national holidays. **Contact:** team@plotarmour.in or +91 87440 69597. **Escalation:** Shubhankar Rakshit, CFO.
- Included each month: up to **4 hours** of configuration work (users, roles, labels, rates, small report changes). Larger work is a change request (section 9).

05 Backups and restore

- We take a backup of Stylified's database and files **every day** and keep them for at least **30 days**.
- Before go-live we **rehearse a restore** on Stylified's workspace and show you the result. It is one of the acceptance criteria in document 2.
- If data is lost or damaged, we restore from the latest good backup on request, normally within 2 working days. A restore returns the workspace to the time of the backup, so entries made after it must be entered again.
- A correction to a wrong entry never needs a restore: entries are corrected by reversal and both rows stay.

06 Your data

- **It is yours.** Everything Stylified enters (lots, bundles, karigars, wages, photographs, notes) belongs to Stylified. We use it only to run the service for you and to support you.
- **Export at any time.** On request we give you all records as CSV and all files in their original form with an index, within 5 working days, at no extra charge.
- **When the service ends.** We keep your data for 30 days so you can export it, then delete it from the live system and, on your request, confirm the deletion in writing. Backups age out within a further 30 days.
- **Support access.** Our staff open your workspace only to support you; each such session is recorded in your own audit trail and time-limited.

07 Security

- Each company's data is separated by the database itself, not only by the application, and the platform refuses to run if that separation is switched off.
- Every action is checked against the user's role on the server. Every entry records who made it and when. Entries cannot be edited, only reversed.
- Traffic is encrypted. Passwords are held by the sign-in system, not by Verity. Secrets are kept in the hosting environment, never in code.
- If we confirm that Stylified's data has been exposed to someone who should not see it, we tell you without undue delay and within 72 hours of confirming it.

08 Ownership of the software

- Verity, and everything built inside it for this project, remains the property of PlotArmour. Stylified receives the right to use it during the term, for its own business.
- General parts we build (for example a better supervisor screen) may be reused for other customers. Stylified's data, its rates, its rules and anything marked confidential are never shared.

- If Stylified later wants its own copy of the code, that is a separate agreement and a separate price.

09 Changes and what is out of scope

- The scope is fixed by document 2. Anything else (a new screen, a new report layout, an integration, a Phase 2 item) needs a written **change request** with a price and a date, approved by Stylified before work starts.
- Delays caused by late decisions, late data or late testing from Stylified move our dates by the same time.

10 Confidentiality

Each side keeps the other's non-public information confidential, uses it only for this service, and returns or deletes it at the end. We are happy to sign a short mutual confidentiality agreement before Stylified shares its price lists, rates or customer details.

11 Liability and law

- We take care to run the service well, but we cannot promise that it is free of every fault. Our total liability for any claim under this service is limited to the monthly fees Stylified paid in the 3 months before the claim.
- Neither side is liable for indirect loss, such as lost profit, or for events outside its control.
- These terms are governed by the laws of India, and the courts at Delhi have jurisdiction. Both sides try first to settle any dispute by talking to each other.

This document is a draft prepared by PlotArmour. It is not legal advice. Both sides should have the final text reviewed before signing.

Who we are, and what Verity is

This document states only facts the company has supplied. It makes no claim about clients, references or credentials beyond those listed.

01 Company

NAME	PlotArmour
REGISTERED ADDRESS	31/44 St 3, Block 17, Vishwas Nagar, Delhi, India, 110032
GSTIN	07TQDPS9711L1ZT
PHONE	+91 87440 69597
EMAIL	team@plotarmour.in

PlotArmour owns and develops **Verity**, an operations platform for service and manufacturing organisations.

02 Why Verity suits Stylified

Verity is a modular platform: the same foundation (data isolation per company, role-based permissions, audit trail, append-only ledgers, approvals, notifications) carries every module, so new roles, stages and users are added without redeveloping it. Stylified's needs are a piece-rate cycle with careful counting, honest money and a known cost for every lot, which is what the piece-rate module on that foundation does.

CAPABILITY	STATE	FOR STYLIFIED
Per-company data isolation, role and permission model, audit trail, approvals, notifications, file storage	Platform, in use across Verity	Six roles, limits you set, photographs
Lots, numbered bundles, slips and labels with QR, scanning	Piece-rate module, tested, shown on fictional data	Your stages, rate card, numbering and challan heading
Give out and take back with the receiver's count, cases, charge requests, rework, wage bases, advances, deductions, payments	Piece-rate module, tested, shown on fictional data	Your karigars, rates and reasons
Ready garment inventory: opening stock, stock out, count corrections, a reversible ledger	Piece-rate module, tested, shown on fictional data	Your designs, parties and stock

CAPABILITY	STATE	FOR STYLIFIED
Fabric rolls, stock, labels, lot costing with shared bills, cost per good piece	Piece-rate module, tested, shown on fictional data	Your fabrics, suppliers and cost categories
Team: roles, people, stages, karigar profiles, a supervisor per karigar, username sign-in	Piece-rate module, tested, shown on fictional data	Your people
Reports with Excel, CSV and PDF, a change history, a factory dashboard	Piece-rate module, tested, shown on fictional data	Your lots
Hindi and English on the floor screens, daily entry and slips	Built	Your labels and reasons in both languages
Hindi on the office screens, join or link lots, packing and dispatch, WhatsApp and SMS, Tally export	Not built	Quoted separately when you ask

03 Experience

PlotArmour has completed **10+ past projects, with values from ₹1 lakh to ₹20 lakh**. We do not claim, in this document, previous deployments in garment manufacturing or piece-rate payroll. The piece-rate module is our own product, built from your requirement sheet and the working chat with your team, and tested against the sheet's own worked examples. Further detail on past work can be discussed under a confidentiality agreement (document 3, section 10).

04 Leadership, teams and support

NAME	ROLE	BASED IN
Divyom Sharma	Co-Founder & CEO	Delhi
Nakshatra Aggarwal	Co-Founder & CEO	Edinburgh, UK
Shubhankar Rakshit	CFO	Delhi
Ayushmaan Gaur	COO	Chennai

The people and allocation for this project (project management, build, testing and go-live) are confirmed in writing at kickoff.

Support and escalation: team@plotarmour.in or +91 87440 69597, on the hours in document 3, section 4.
Escalation contact: Shubhankar Rakshit, CFO.

05 How a Verity workspace feels

One system, every role

The owner, the manager, the supervisor and the munshi use the same product with different screens. What each can do comes from their role, checked on the server.

Honest numbers

Good, rejected, rework and short are kept apart and never mixed. Every figure on a dashboard is worked out from the entries behind it, so a number can always be traced to the entry that made it.

Made for a phone on the floor

Supervisor screens are designed for a phone first: scan a bundle with the camera, large touch targets, counting with plus and minus, a photograph from the camera.

Dark and light

Every screen works in a dark and a light theme, so it is comfortable in a bright cutting room and on an evening shift.

06 Demonstration

We can show the piece-rate module on fictional garment data at your premises or remotely, and we will say clearly what runs today and what is not built. The demonstration script is in document 2, section 9.

07 Confidentiality

We will sign a mutual confidentiality agreement before Stylified shares sensitive information, and we treat your requirements, rates and business rules as confidential. Support access to your workspace is recorded in your audit trail. At the end of the service we delete or return Stylified's material we hold, as set out in document 3.

How it is built

For Stylified's owner and for anyone you ask to review the solution. It says what exists, how it is checked, and what is not built.

01 Overview

Stylified gets its own workspace on Verity's hosted platform. The workspace is a set of screens and rules for the piece-rate cycle, on top of a shared foundation that provides sign-in, roles, an audit trail, files, notifications and company isolation.

EXPERIENCE	Web application for desktop, tablet and phone, dark and light themes. Supervisor screens are designed phone-first and open from a camera scan. Hindi and English labels on the floor screens, daily entry and slips.
PIECE-RATE MODULE	Fabric rolls, lots and rate cards, bundles, stages, karigars and rates, handovers and returns, rework, cases, wages and money, lot costing, approvals, day close, team, reports. Every change is a *command* with its own checks; every screen reads through a *query*.
PLATFORM FOUNDATION	Company isolation, identity and memberships, roles built from permissions, an audit trail, an event log, file storage, notifications, numbering, configuration.
DATA AND HOSTING	A relational database with row-level security forced on every Stylified table, file storage, application hosting in an Indian region, backups.

02 Hosting

PART	WHERE AND HOW
Application	Hosted serverless application, deployed to the Mumbai region (configured in the deployment settings)
Database	Managed PostgreSQL in the Mumbai region, reached through a connection pooler in transaction mode. The application connects as a restricted role that cannot bypass row-level security
Files	Object storage with the same company isolation; used for photographs
Sign-in	The platform's identity service; passwords never reach Verity's own tables

PART	WHERE AND HOW
Environments	A demonstration workspace with fictional data and Stylified's own workspace are separate tenants. Nothing is shared between them
Deployment shape	Verity's shared hosted deployment (one application and database for many companies, each isolated as in section 3). A dedicated instance on Stylified's own Vercel and Supabase accounts is **not part of this solution**: see below

If Stylified later wants its own accounts

Running Verity on a customer's own Vercel and Supabase accounts is feasible but not yet built or validated. Our research lists what must be done first: scripting the creation of the restricted database role the application connects as, a scripted first-operator and first-company setup on a fresh Supabase project, a scheduled-jobs setup per instance, separate file and database backups, a release and migration channel for more than one instance, and a support model without a shared console. A rehearsal on throwaway accounts must pass before any real data moves. Provider plans must allow business use (Vercel Pro and Supabase Pro are the minimum; free plans are not suitable). We will quote the move separately once this is done; until then the isolation, backup and security statements in this document describe the shared hosted deployment only.

Provider names and plans can change over the life of the service; the data stays in an Indian region and the isolation rules below do not change.

03 Company isolation

- Every Stylified record carries the company it belongs to. The database itself refuses to return or accept a row for another company: row-level security is **forced** on each table and the company is set for each request from the signed-in user's verified membership, **never from anything the browser sends**.
- If no company is set, a query returns nothing and a write is rejected: isolation fails closed.
- The platform checks at startup that its database role is one that cannot bypass these rules, and refuses to run otherwise. An automated test proves that one company cannot read another's data.

04 Roles and permissions

- A permission is an action on a kind of record within a scope (for example "issue" on a piece-rate entry for the company). A role is a named set of permissions. There are no hard-coded role names in the code, so changing a role is a setting, not a release.
- The six Stylified roles (Owner, Manager, Supervisor, Munshi, Store, Cutting master) and their matrix are in document 2, section 4. They are installed once per workspace from a preset and can be edited.
- The server checks the permission for every command and every query. Hiding a button is only a convenience; it is never the control.
- **Supervisor scope.** The platform's scope list stays as it is. A supervisor's assigned stages are held as a small record in the piece-rate module, and a karigar can be set under a supervisor. The give-out and take-back commands refuse a supervisor acting on a stage that is not theirs, and a give-out to a karigar who is set under another supervisor. This is tested with a second supervisor.

05 The data model

RECORD	WHAT IT HOLDS	RULES
Stage	A step in the line, in order, with a default rate per piece, an active flag and whether it is required or optional (a lot can skip only an optional stage)	Stages are Stylified's data; they can be renamed and reordered
Roll and roll movement	Roll number, fabric, unit (metres or kilograms), quantity, supplier, invoice, rate, and every movement in or out	Append-only movements; the balance is worked out from them; a repeated invoice is warned
Lot and lot rate card	Number, name, design, planned pieces, dates, status; a rate per stage for this lot, and a stage can be skipped	Numbers are gapless and never reused; a closed lot is locked. The lot's rate is used before the worker's, then the stage default
Bundle	Number B-0001 onward, net pieces, size-mix note, the lot and the rolls it was cut from	Numbers are gapless per workspace; bundles can be split or joined at the cutting table until work has left it
Karigar or unit	Name, kind, contact, address, joined on, ID note, emergency contact, the supervisor, active	Retired, never deleted
Rate	Rupees per piece for a karigar at a stage, the wage basis, the date it applies from	History is kept; each entry takes a snapshot of the rate used
Entry (issue or return)	Bundle, stage, karigar, pieces sent and counted, due date, confirmation method, challan number, and for a return the split into good, rejected, rework and short	Append-only. A database check makes the four parts sum to the pieces returned. Corrections are reversals
Payment	Advance, recovery, deduction, payment or opening balance, amount, mode, reference, reason	Append-only; amounts are whole paise, so there is no rounding drift
Lot cost	A cost in one of your categories against a lot, with the date and who entered it	Append-only; a cost named like fabric, wages or a stage is refused (already counted)
Ready stock move	Opening stock (named, no lot), stock out with the party and reference, and count corrections with a reason; what production made ready is derived from the bundles	Append-only; a reversal is the only undo; nothing can leave that is not in stock
Stage assignment	A supervisor and a stage	Set by the owner; checked by the commands
Approval and case	Kind (deduction, write-off, hold, close, charge), subject, amount or pieces, requester, state, decision and reason; a case ties a shortage to the worker who held the pieces and the supervisor who recorded it	Decided once; above-limit requests need the owner; nobody decides their own request
Evidence photo	A photograph about a rejected or rework entry; lot pictures set up with you	Stored with company isolation; never a public link

RECORD	WHAT IT HOLDS	RULES
Day close	Supervisor, date, summary figures at the time, a note	Frozen once submitted
Settings and reasons	Manager limits, the lost-piece charge, the low-fabric level, the challan heading, reasons and cost categories in two languages	Your data, editable on screen

How the figures are made

Nothing on a dashboard is typed in. Pieces out, pieces waiting, good, rejected, rework, short, days at a stage, roll balances, wages, balances and lot costs are all computed from the entries, movements and payments by one piece of logic, which is covered by automated tests that use the worked examples from your requirement sheet (for example 100 pieces issued, 94 good, 2 rejected, 1 rework, 2 short and 1 still open; and ₹48,000 over 960 good pieces is ₹50 a piece). A figure on a report always agrees with the entries it is built from.

06 Audit and corrections

- Every command records who did it, when, from which role, and what changed, in an audit trail the owner can read.
- Entries, payments and rate history cannot be updated or deleted by the application: a database rule rejects both. A wrong entry is cancelled by a **reversal** with a reason; the original and the reversal both stay visible.
- A reversal that would leave a later stage with more pieces than it received is refused.

07 Photographs

- A photograph is uploaded from the phone camera or a file, checked for type and size, stored in the company's isolated storage, and shown through a short-lived link only to users who may see the record.
- Pictures are resized for the screen so lists stay fast.

08 Backups and recovery

- A daily backup of the database and files, kept for at least 30 days, is part of the service (document 3, section 5). The mechanism (the hosting provider's backups plus our own nightly export) is configured and a **restore is rehearsed** on Stylified's workspace before go-live; that rehearsal is an acceptance criterion.
- Because corrections are reversals, a restore is needed only for loss or damage, not for ordinary mistakes.

09 Security summary

CONCERN	CONTROL
One company seeing another's data	Forced row-level security in the database; company taken from the verified membership; tested

CONCERN	CONTROL
A user doing more than their role allows	Server-side permission check on every command and query; tested
Altering history	Append-only ledgers enforced by the database; reversal only
Staff access to your data	Only to support you; each session recorded in your audit trail and time-limited
Secrets	Held in the hosting environment, never in code or in the database
Public links	The bundle QR opens a sign-in screen, then the bundle. It carries only the bundle's address, no figures or names. Roll and challan labels work the same way

10 Speed

Measured on a production build of the demonstration workspace with the database beside the application: a page is made on the server in 50 to 80 milliseconds and is idle in the browser in 0.7 to 1.0 seconds. On a year of generated history (24,000 entries over 120 lots) the factory dashboard takes about 0.5 seconds, the lot list 0.5 seconds and the supervisor's screens about 50 milliseconds. On the hosted service the network and the sign-in check add to these; we will report measured times on Stylified's workspace before go-live, not estimates.

11 Testing

LAYER	WHAT IS COVERED
Logic tests	The piece-rate calculations, the spreadsheet writer and the sign-in address rules, using the requirement sheet's own examples
Database tests	More than 85 tests in all against a real database: stage and karigar scope for supervisors, approvals within the owner's limits, the frozen day close, reconciliation, over-issue and over-return refusals, rework pool, the wage bases and the lot rate card, the receiver's count with cases and charge requests, rolls and fabric used by a cut, lot costing and its refusals, ready stock in and out, required and optional stages, where each role opens, role presets that cannot grant more than the installer holds, opening balances, append-only rules, company isolation
Platform tests	Identity, membership, tenant isolation and permission tests that every capability inherits
Browser checks	Every route opened as each role in dark and light on desktop and at 390 px, with the demonstration data, before go-live; defects are logged and fixed
Acceptance	The criteria in document 2, section 10, run with Stylified

12 Where things stand, and what follows

- The piece-rate module is built and proven on demonstration data in our test environment; it moves onto Stylified's own workspace and people at kickoff.
- Speed on the hosted service is measured on your workspace during the week-three checks; the figures above are from a local build.
- The hosted run (photograph storage, a supervisor on a real phone) and the restore rehearsal happen on your workspace before go-live and are acceptance criteria.
- Not built: joining whole lots, Hindi on the office screens, packing and dispatch, WhatsApp or SMS, offline use, a Tally export. They are quoted separately.
- A deployment on Stylified's own Vercel and Supabase accounts is a later option, offered after a full rehearsal.

verity

Acceptance walkthrough

Every check we agree before go-live, in the order to run it, with the figures to expect and a place to record the result.

How we agree it is done

Run these checks with us on Stylified's own workspace, one at a time. Each says what to do, what you should see, and leaves a box to tick. When every box is ticked, the owner signs at the end and the service starts.

01 Before you start

- One person from Stylified runs the screens (the owner or Ayushmaan), one from PlotArmour watches and fixes anything we find.
- Use a test lot with a few bundles, not a live one, until check 17.
- Have a phone with a camera and a printer connected, so the labels, slips and challans are really printed.
- A check that fails is written down with what happened, fixed, and run again. It is never skipped.

02 The checks

#	WHAT TO DO	WHAT YOU SHOULD SEE	RESULT
1	**Roles.** Sign in as each person: owner, manager, supervisor, munshi, store, cutting master. Try to open a screen the role should not have.	Each opens on their own page and sees only their screens. A supervisor cannot open wages. A supervisor cannot give out at a stage that is not theirs, nor to a karigar set under another supervisor.	☐ Pass ☐ Fail
2	**The sheet's reconciliation.** Issue 100 pieces on a bundle. Take back 94 good, 2 rejected, 1 rework, 2 short.	The screen reads "accounted for 99 of 100, 1 stays open". 100 = 94 + 2 + 1 + 2 + 1 open.	☐ Pass ☐ Fail
3	**Receiver's count.** Give out 100. Take back 98 and say 2 are short.	2 appear as a case on the worker who held them, with a charge request, both people recorded, the challan and the history kept. The receiver's count is the one that stands.	☐ Pass ☐ Fail
4	**Over-count and correction.** Try to take back more pieces than are out. Then reverse a saved entry with a reason.	The over-count is refused with the figures and Save stays off. The reversal leaves both rows on record and the figures return to what they were.	☐ Pass ☐ Fail
5	**Photograph.** On a rejected or rework return, take a photograph with the phone.	It shows on the entry, in the register and in the manager's approval.	☐ Pass ☐ Fail

#	WHAT TO DO	WHAT YOU SHOULD SEE	RESULT
6	**Limits.** Raise a deduction above the manager's limit and one below it.	The manager can approve the one below and sees "needs the owner" on the other; only the owner can approve it. Nobody can decide their own request.	☐ Pass ☐ Fail
7	**Closed lot.** Complete and close a lot, then try to change it.	A closed lot cannot be changed. Closing is refused while pieces are pending or in rework.	☐ Pass ☐ Fail
8	**Fabric.** Receive three rolls and print the labels. Scan one with the phone. Cut a lot from them. Enter the same invoice number again.	Each roll has a number and a QR label; scanning opens it. The cut lowers each roll's balance by what was used. The repeated invoice is warned before it is saved.	☐ Pass ☐ Fail
9	**Lot cost.** Add a thread cost to a lot. Try to add a cost called "Fabric" or "Stitching".	The lot's cost equals fabric plus wages plus other costs, less charges recovered, with the cost per good piece. The "Fabric" and "Stitching" costs are refused because they are already counted.	☐ Pass ☐ Fail
10	**Opening balances.** Enter opening fabric stock, one karigar's opening balance owed, and an advance already given. Reverse one of them.	They appear on the fabric ledger and the karigar's account; the reversal leaves both rows; balances are right.	☐ Pass ☐ Fail
11	**Team.** Add a person with a role, stages and a username. Sign in as them. Then switch them off.	The new person signs in with the role and stages given. After switching off they cannot sign in, and their history stays.	☐ Pass ☐ Fail
12	**Excel and PDF.** Download three reports to Excel and print one to PDF.	The totals in the files equal the totals on the screen.	☐ Pass ☐ Fail
13	**Phone and themes.** Open every screen of your role at desktop width and at phone width, in light and dark.	Nothing is cut off, overlaps or scrolls sideways; every button can be pressed with a thumb.	☐ Pass ☐ Fail
14	**Hindi.** Switch a supervisor's phone to Hindi and open every floor screen, the daily entry and a slip.	Labels are in Hindi; names and codes stay as they are. (The owner and office screens are English in this release: decision D-15.)	☐ Pass ☐ Fail
15	**Backup.** We take a backup and restore it into a separate copy in front of you.	The restored copy has the same lots, bundles and balances. A restore returns the workspace to the time of the backup.	☐ Pass ☐ Fail
16	**Ready stock.** Enter opening ready stock. Take some out as sold. Try to take out more than is in stock. Correct a count with a reason. Reverse the stock-out.	The balance is what was made plus opening less what went out. Taking out more than is there is refused. The count correction needs a reason. The reversal returns the stock and both rows stay on the ledger.	☐ Pass ☐ Fail

#	WHAT TO DO	WHAT YOU SHOULD SEE	RESULT
17	**Optional stages.** Try to skip a required stage on a lot's rate card. Mark a stage optional and skip it.	A required stage cannot be skipped, and the screen says why. After marking it optional the lot skips it and its pieces go on to the next stage.	☐ Pass ☐ Fail

03 The pilot, before paper stops

STEP	WHAT WE DO	WE AGREE IT WHEN
Test lot	One real lot runs through every stage with one supervisor and two karigars, paper running beside it	Every difference between paper and Verity is written down and explained
Parallel run	All lots in the stages already proven, paper kept as the control for two weeks	The wages, pieces and balances agree on paper and in Verity
Cutover	Stage by stage, pasting first and finishing last	The owner signs each stage as moved

04 Sign-off

All checks above are ticked, and the opening balances on the workspace have been counted and accepted by the owner.

Document 2, section 10 lists the same criteria in the language of the scope. If a check cannot be run on the day (for example the printer is not yet connected), it is written down with the reason and run before the service starts; nothing is signed with a check open.
